## 벡터화

#### What is vectorization?

• for문을 없애 딥러닝의 학습 시간 단축시킴

ex.

```
import numpy as np

a = np.array([1,2,3,4])

# Vectorized
import time

a = np.random.rand(1000000)

b = np.random.rand(1000000)

tic = time.time()

c = np.dot(a,b) # 행렬곱

toc = time.time()

print("Vectorized version:" + str(1000*(toc-tic))+"ms")
```

#### >> 실행시간: 1.5ms

```
# For loop

c = 0

tic = time.time()

for i in range(100000):
    c += a[i]*b[i]

toc = time.time()
```

```
print("For loop:"+str(1000*(toc-tic))+"ms")
```

>> 실행시간: 500ms

→ 가능하면 for문을 쓰지 않는다!

### **More Vectorization Examples**

```
# Non-vecotrized ver.
u = np.zeros((n,1))
for i in range(n):
    u[i] = math.exp(v[i])

# Vectorized ver.
import numpy as np
u = np.exp(v)
